

DEV-073 | V1 REQUIRED

Guided First Use

Developer action checklist. Build only what is listed here.

THE AI GROWTH OPERATING SYSTEM

Simplified developer handoff | August 25, 2026

Understand | Discover | Strategize | Approve | Execute | Measure | Learn

1. What development must deliver

Required result

A new customer must be guided from an empty workspace to one validated Next Best Action. The customer should never need to decide which internal tool to open.

Use the onboarding, workspace, project, business profile, integrations, readiness, approval, Capacity and Next Best Action functionality that already exists. This document does not authorize a new module or new infrastructure.

1

Add one setup checklist to the dashboard

Show the checklist until required setup is complete. If the user leaves, Continue setup must return to the first incomplete step.

2

Route each checklist item to the correct existing screen

Keep the current workspace and project selected. Do not send the user to a generic tool menu.

3

Calculate completion from saved system state

Users must not be able to mark steps complete manually. Reopen a completed step if required data, evidence or permission becomes invalid.

4

Validate before showing the first Next Best Action

Use verified business information, current evidence, permissions, Capacity and approval requirements. If validation fails, show the recovery action instead.

5

Finish onboarding at the first useful priority

When setup is ready, change the dashboard action to Open your Next Best Action and display the validated recommendation.

Do not build

Do not create a separate onboarding module, academy, learning center, tool directory, provider, crawler, queue, scheduler or AI service. Do not require every optional integration and do not add a customer controlled completion checkbox.

2. Build the first run sequence

Use this order. A step may be skipped only when it is not applicable or when an approved optional deferral is allowed.

Step	Developer action	Complete when
1. Welcome	Show the outcome and start or resume setup.	The active workspace is loaded.
2. Workspace	Show Entrepreneur, Business or Agency. Never show Personal.	Workspace type and entitlement are confirmed.
3. Project	Create or select the first project. Agency must create or select a client first.	A valid project exists in the selected workspace.
4. Business profile	Request only required missing business information. Reuse saved information.	Required identity, offer, audience and goals are saved.
5. Website	Connect the existing website or open the approved website creation path.	Website state is known or correctly marked not applicable.
6. Evidence	Show available analytics, search, local, ecommerce and publishing connections.	Every relevant source has an honest status.
7. Team	Show only for Business and Agency. Allow invitation to be deferred.	Roles and approval responsibilities are understood.
8. Approval mode	Save Manual, Assisted or Trusted and explain the protected actions that still pause.	Mode, actor and time are recorded.
9. Readiness	Calculate blockers and show one clear recovery action for each blocker.	Required prerequisites pass or a recovery action is shown.
10. Discovery	Run eligible discovery using the current estimate, confirmation and duplicate protection.	A current evidence snapshot and result exist.
11. First priority	Show the validated Next Best Action with its reason and required approval.	The NBA is saved and visible on the dashboard.

3. Apply the correct workspace behavior

Workspace	Required developer behavior
Entrepreneur	Create one business project. Hide team invitation. Use 1 owner seat and 2,000 monthly AI Capacity. Remove all Personal and Client terminology.
Business	Create the business project. Show the included team invitation for 1 additional team member. Use 5,000 monthly AI Capacity. The authorized team uses the same verified business profile and evidence.
Agency	Create or select a client before creating the project. Show invitations for 2 additional internal team members. Use 18,000 shared monthly AI Capacity. Keep every client's business profile, evidence, Strategy, tasks, approvals, history and reports isolated.

Agency requirement

Agency Client Viewer access is separate from internal seats. A Client Viewer sees only information explicitly permitted for that client and does not receive normal AI Capacity.

Use this interface copy

Location	Exact copy
Welcome heading	Let's understand your business and determine what should happen next.
Welcome text	Complete the guided setup once. SEnuke AI will use your verified business information and available evidence to build a customized Strategy and recommend the first Next Best Action.
Progress label	Setup progress
Resume button	Continue setup
Capacity helper	Before chargeable work begins, SEnuke AI will show the estimated AI Capacity requirement.
Approval helper	Publishing and protected external changes always require the appropriate permission and approval.
Completion heading	Your workspace is ready.
Completion button	Open your Next Best Action

4. Implement checklist state correctly

Each checklist item must use one of these states: Not started, In progress, Complete, Blocked, Deferred or Not applicable.

- Derive the state from saved backend records, not local interface state.
- Store the current workspace, project, onboarding version and step states.
- Store the verified business profile version, evidence snapshot, readiness snapshot, approval mode and current NBA id.
- Selecting an incomplete item must open the correct screen and preserve workspace and project context.
- Optional items may be deferred. Show the resulting limitation wherever it affects analysis or recommendations.
- If required information, evidence or permission is later removed, change the affected step to Needs attention or Blocked.
- Show only one authoritative Next Best Action. Setup cards must not compete with it.

Show honest recovery states

Problem	Message	Primary action
No project	Create your first project.	Create project
Profile incomplete	Complete the required business information.	Continue business profile
Website required	Add an existing website or use the approved website creation path.	Add or create website
Connection required	Connect the eligible source.	Open integrations
Permission required	Ask an authorized owner or approver.	View required role
Capacity required	Review the estimate and available Capacity.	Review AI Capacity
Approval required	Review the exact pending version.	Open Approval Center
Provider error	Keep the last verified result and retry safely.	View connection status
Insufficient evidence	Supply or connect the missing evidence.	Review missing evidence

5. Validate the first Next Best Action

Do not create or display the first Next Best Action until every required check below passes.

- Required business information is present and belongs to the selected project.
- Every evidence source retains its source, date, freshness and provider status.
- Missing, stale or failed data is not displayed as a successful zero.
- The recommendation is tied to the current evidence snapshot and is not a duplicate.
- Priority scoring can be traced to the current scoring factors and version.
- Dependencies, permissions and required approvals are known.
- The action is allowed for the current workspace, role and entitlement.
- Chargeable work has an estimate and sufficient available Capacity.
- The customer can see why this is the priority, the expected impact, confidence, risk, Capacity requirement and what happens next.

If validation fails

Do not show a weak or invented recommendation. Show the highest priority recovery action and state exactly what information, evidence, connection, permission or Capacity is required.

6. Enforce safeguards in the backend

- Enforce Manual, Assisted and Trusted behavior server side.
- Changing approval mode requires confirmation and an audit record.
- No protected external action may run without the required role, permission and approval for the exact version.
- Show an estimate before chargeable analysis. Reserve Capacity only after confirmation.
- Double click, retry, refresh, back navigation and repeated API requests must not create duplicate jobs or duplicate charges.
- Release or refund Capacity reservations when existing failure safeguards require it.
- Passive monitoring must not deduct visible customer AI Capacity.
- Team members share workspace Capacity. Additional seats add access, not Capacity.

Record these events

Use the existing analytics or audit event system. Do not create a new analytics service.

Event	Minimum data
onboarding_started	Workspace, plan, actor and onboarding version
onboarding_step_opened	Step, route and current state
onboarding_step_completed	Step, completion source and duration
onboarding_step_deferred	Step, reason and limitation
onboarding_blocked	Step, blocker and recovery route
approval_mode_changed	Old mode, new mode, actor and confirmation
first_discovery_started/completed	Evidence snapshot, estimate, job id, duration, Capacity and status
first_nba_presented	NBA id, evidence snapshot, confidence and dependencies
onboarding_completed	Workspace, project, duration and deferred optional steps

7. Development completion checklist

- A new Entrepreneur customer reaches a valid Next Best Action without seeing Personal or Client terminology.
- A new Business customer sees the owner plus 1 included team member path.
- A new Agency customer creates a client before a project and sees the owner plus 2 included internal team members path.
- Agency client data remains isolated across every relevant record and screen.
- Setup resumes at the first incomplete step after refresh, logout, deep link or back navigation.
- Optional missing integrations do not create a dead end and their limitations remain visible.
- Every blocker provides one truthful explanation and one working recovery action.
- No readiness or confidence claim is shown when required evidence is missing.
- No chargeable or external action begins without the required estimate, permission and approval.
- Repeated requests do not create duplicate analysis jobs, publishing actions or Capacity charges.
- The first Next Best Action records evidence, rationale, confidence, expected impact, dependencies, Capacity and approval state.
- Dashboard, Project, Readiness and Next Best Action views all show the same completion state.
- Keyboard navigation, focus, accessible labels, noncolor status indicators and mobile layouts pass QA.

Test these conditions

Test all three workspaces with owner, team and insufficient permission roles. Include no project, partial setup, ready, blocked, stale evidence, provider error, low Capacity, insufficient Capacity, pending approval, refresh, back navigation, deep link, repeated submission, retry, mobile, tablet and desktop.

Definition of done

A new customer completes the guided setup, understands what is missing or requires approval and reaches one trustworthy Next Best Action without needing to understand the internal tool architecture.

Scope: V1 REQUIRED. Reuse existing services. No new infrastructure or provider is approved by this document.
